## AMAL <br> The Carburetter of Records \& Successes

SECTIONAL ILLUSTRATIONS

## HOW THE CARBURETTER WORKS

The carburetter proportions and atomises the right amount of petrol with the air that is drawn in by the engine because of the correct proportions
of jet sizes and the main choke bore. The float chamber maintains a constant of jet sizes and the main choke bore. The flatat chamber maintains a constant

The throttle control from the handlebar controls the volume of mixture
and therefore the power, and at all positions of the throttle the mixture is and therefore the power, and at all positions of the throttie the mixture is the mixture supply from the pilot jet system for idling, then as it progres,
sively opens, via the pilot by-pass the mixture is augmented from sively opens, via the pilot by-pass the mixture is augmented from the main
jet, the earlier stages of which action is controlled by the needle in the needle jer. The pilot jet system is supplied by the pilot jet (30) Which
is detachable on removal of the float chamber. On certain other ©bdels is detachable on removal of the float chamber. On certain other lodels
no pilot jet is fitted but a pilot bush is inserted in the continuaticy of the no pilot jet is fitted but a pilot bush is inserted in the continuaticy of the
pilot air adjusting screw passage. The main jet does not spray orkecty into the mixing chamber, but discharges through the needle iet inte9the primary
air chamber, and goes from there as a rich petrol-air mixture through the air chamber, and goes from there as a rich
primary air choke into the main air choke.
The carburetters usually have a separately operat mixture control
called an air valve, for use when starting from cold called an air valve, for use when starting from cold, until the engine is warm ; this control partially blocks the passage of yir through the main
choke.
This design of carburetter offers perfectly fimple and effective tuning
facilities. facilities.

## HINTS AND TIPS

STARTING from cold. Turn on fuel supply, set ignition (if manually operated) for best slow running, depress tickler to flood float chamber close air valve, open throttle slightly and start engine. When engine starts
open air valve and close the throttle ; if engine begins to falter, partially open air vaive alv custe the throtte ; if engine begins to falter, partiall
close the air valve until engine is warm, then set in fully open position.

STARTING, engine hot. Open throttle slightly and start engine. should not normally be necessary to flood the float chamber or close the air valve when starting a warm engine.

STARTING, general. Experience will show when it is necessary to flood the carburetter or use the air valve and also the best setting of the throttl valve. If the carburetter has been over-flooded or strangled, which would result in a wet engine and over-rich starting mixture-fully open the
throttle valve and air valve, give the engine several turns to clear the richness, then start again with the air valve fully open and the throttle valve slightly open.

STARTING, SINGLE LEVER CARBURETTERS, OPEN THE AND FLOOD THE CARBURETTER MORE OR LESS POSITION AND FLOOD THE CARBURETTER MORE OR LESS ACCORD
ING TO THE ENGINE BEING COLD OR HOT RESPECTIVELY

CABLE CONTROLS. See that there is a minimum of backlash when the controls are set back and that any movement of the handlebar does not cause the throttle to open; this is done by the adjusters on top of the
carburetter, after releasing the adjuster locknuts. See that the throttle carburetter, after releasing the adjuster lockn
valve shuts down freely, then reset locknuts.

PETROL FEED. A filter gauze is fitted at the inlet to the float chambe to remove this gauze unscrew the banjo boit (9) the banjo and filter gauz can then be removed. Before replacement ensure that the filter gauze is both clean and undamaged and check fuel supply by momentarily turning
on fuel tap. Vertical loops in petrol pipes must be avoided to prevent air on fuel tap. Vertical loops in petrol pipes must be avoided to prevent air
locks. Float chamber flooding may be due to a worn float needle but nearly all flooding and blockage of the filter gauze with new machines is due to impurities from the tank. Periodically clean out filter gauze and floa chamber until the trouble ceases or alternatively the tank may be draine and swilled out, etc.

FIXING CARBURETTER AND AIR LEAKS. Erratic slow running is often caused by air leaks, so verify there are none at the point of attachment to the cylinder or inlet pipe. A sealing ring is fitted into the attachment
flange of the carburetter. Also in old machines look out for air leaks flange of the carburetter. Also in old machines look
caused by a worn throttle or worn inlet valve guide.

BANGING IN EXHAUST may be caused by too weak a pilot mixture
BANGING IN EXHAUST may be caused by too weak a pilot mixture rich a pilot mixture and an air leak in the exhaust system ; The reason in either case is that the mixture has not fired in the cylinder and has fired in the hot silencer. If the banging happens when the throttle is fairly wide open the trouble will be ignition-not carburation.

BAD PETROL CONSUMPTION of a new machine may be due to flooding, caused by impurities from the petrol tank lodging on the float by a worn float needle valve. Also bad petrol consumption will be apparent if the needle jet (24) has worn : it may be remedied or improved by lowering the needle in the throttle, but if it cannot be-then the only remedy is to get a new needle jet.

AIR FILTERS. These may affect the jet setting, so if one is fitted after wards to the carburetter the main jet may have to be smaller. If a carburetter is set with an air filter and the engine is run without it, take care not to overheat the engine due to too weak a mixture; testing with the
air valve (page 5 ), will indicate if a larger main jet and higher needle position air valve (page

EFFECT OF ALTITUDE ON CARBURETTER. Increased altitude tends to produce a rich mixture. The greater the altitude, the smalle up to 3,000 feet approximately. Carburetters used constantly at altitudes 3,000 to 6,000 feet should have a reduction in main jet size of 5 per cent. and thereafter for every 3,000 feet in excess of 6,000 feet altitude further

## AMAL

Series 600 and 900

## AMAL <br> The Carburetter of Records \& Successes

PARTS TO TUNE UP WITH

THROTTLE ADJUSTING SCREW (26). Set this screw to hold the throttle open sufficiently to keep the engine running when the twist grip
is off. An "O" ring is fitted to the screw to hold this adjustment by is off.
friction.

MAIN JET (29). The main jet controls the petrol supply when the throttle is more than three-quarters open, but at supply of fuel goes through the main jet, the amount is diminished by the metering effect of the needle in the needle jet. Each jet is calibrated and numbered so two jets of the same number are alike. NEVER REAMER A JET OUT, GET ANOTHER OF THE RIGHT SIZE. Th
bigger the number the bigger the jet.
o remove the main jet, remove the float chamber, the exposed main jet can then be unscrewed from the jet holde
(28).

NEEDLE AND NEEDLE JET ( 22 and 24). The needle being taper either allows more or less petrol to pass through the needle jet as the throttle is opened or closed throughout the range except when idling or
nearly full throttle.. The taper needle position in relation to the throttle valve can be set according to the mixture required by repositioning the jet needle clip in any of three positions thus raising or lowering it. Raising the needle richens the mixture and lowering it weakens the mixture at page 7). The throttle needles are marked with a single groove around the top diameter for use on the 600 series carburetter, the 900 series carburetter needles are identified by three grooves around the top of the needle,
throttle needles indentified by two grooves are used on certain models for throttle needles indentified by two
both series 600 and 900 carburetters.

THROTTLE VALVE CUT-AWAY. The atmospheric side of the throttle is cut away to influence the depression on the main fuel supply and thus gives a means of tuning between the pilot and needle jet range marked on the throttle valve, viz, $622 / 3$ means throttle valve type 622 with No. 3 cut-away; larger cut-aways, say 4 and 5 , give weaker mixtures and 2 a richer mixture.

AIR VALVE (3) is used only for starting and running when cold, and for experimenting with, otherwise run with it wide open.

TICKLER (25), a small plunger spring loaded, fixed in the carburetter body. When. pressed down on the float, the needle valve is allowed to mixture until the level of the petrol subsides to normal.

## ALCOHOL FUELS.

When using alcohol fuels the following new components are necessary. A metalic banjo preferably double feed il not
already fitted, float chamber $622 / 051$, banjo bolt washer $13 / 163$, needle jet $622 / 100$, jet needle $622 / 099$ or $58 / 099$ according to type of carburetter, filter gauze 376/093B and banje w.s.ar 14//75. The main jet must be increased for straight alcohol by approximately $150 \%$.
The final setting must be a question of trial and error according to the nature of fuel used.

When using alcohol fuels it is advisable to err on the rich side to avold engine overheating.

HOW TO TUNE UP
PHASES OF AMAL NEEDLE JET CARBURETTER THROTTLE OPENINGS

## SEQUENCEOF,TUNING

 TUNE UP IN THE FOLLOWING ORDERNOTE. The carburetter is automatic ${ }^{\text {ron }}$ roughout the throttle rangethe air valve should always be wide open except when used for starting or until the engine has warmed up. We assume normal petrols are used.
READ REMARKS ON PAGESRU AND 7 for each tuning device and
get the motor going perfectly a quiet road with a slight up gradient get the motor going perfectly ${ }^{\text {Wina a }}$ q
so that on test the engine is pulling.
Ist. MAIN JET with throttle in position I (fig. 5), seems to have bette/ Wwer, the main jet is too small,
Seems to have bette onder, the main jet is too small, valve the engine With a correct sizeg main jet the engine at full throttle should run evenly If testing for speed work ensure that the main jet size is sufficient for the mixture to bo deh enough to keep the engine cool, and to verify this examine the king plug after taking a fast run, declutching and stoppingthe engine (198ckly. If the plug body at its end has a cool appearance the
mixture is correct: if sooty, the mixture is rich: if however there are signs of intense heat, the mixture is too weak and a larger main jet is neces ary.
2nitpil OT JET (fig. 5) with throttle in positions 2 and 5 .
W) engine idling down on ast with the twist grip shut off and the throttle - inning: (1) Screw out throttle adjusting screw until the engine runs sower and begins to falter, then screw pilot air adjusting screw in or out. to make engine run regularly and faster. (2) Now gently lower the throttle
adiusting screw until the engine runs slower and just begins to folter adjusting screw until the engine runs slower and just begins to falter,
adjust the pilot air adjusting screw to get best slow running: if this 2 nd adjustment make engine run too fast, go over the job again a third, time. Both the throttle adjusting screw and pilot air screw have an "O" Ring
3 rd . THROTTLE CUT-AWAY with throttle in position 3 (fig. 5) If, as you take off from the idling position, there is objectionable spitting
from the carburetter, slightly richen the pilot mixture air screw sufficiently, but if this is not effective, screw it back again, and fit a throttle with a smaller cut-away. If the engine jerks under load at this throttle position and there is no spitting, either the jet needle is
much too high or a larger throttle cut-away is required to cure richness. 4th. NEEDLE with throttle in position 4 (fig. 5)
4th. NEEDLE
The needle controls a wide range of throttle opening and also the acceleration. Try the needle in the lower position, viz., with the clip in the groove at the top; if acceleration is poor and with air valve partially closed the results are better, raise the needle by two grooves; if very
much better try lowering needle by one groove and leave it where it is much better try lowering needle by one groove and leave it where it is
best. If mixture is still too rich with clip in groove No. I -the needle jet probably wants replacement because of wear. If the needle itself has had several years' use replace it also.
5th. FINALLY go over the idling again for final touches.

## TUNING TWIN ENGINES WITH TWIN

 CARBURETTERS
## where each cylinder has its own Carburetter

First of all, slacken the Throttle stop screws and put the Twist Grip into the slight backlash in the cables wich backlash shat of there should be slight backlash the cables which backlash can be obtained, If necessary by screwing in the cable adjusting screws on the top of the Carburetter
after releasing lock nuts. Then, wich the Handlebars in the normal position, and with the Throttles closed, adjust the cable adjusting screws so that on the slightest opening of the Twist Grip, both Throttles begin to ope

To set the Carburetters, follow the procedure as given on page 7, and bear in mind these "Hints" which may be useful :-Main Jet sizes ar Plugs after taking a run at full throttle over a straight piece of road : the smallest pair of jets that give the best maximum speed are usually correc provided that the Plugs do not show any signs of excessive heat. It migh be that for really critical tuning, one Carburetter might require a slightly different Jet size from the other.

For slow running, set the Twist Grip to make the Engine run slowly but ust faster than a tick-over ; then gently screw in the Throttle stop the shut position, leaving the Engine running on the Throttle Stops.

The next thing to do is to set each Carburetter according to paragraphi2 on page 7, to obtain the iding by screwing down the Throttie Stop Screw, - Pilot Air Scrws accord

Regarding the setting of the Pilot, a fairly satisfactory method is to detach cylinder as a single unit, set the Pilot Air Adjusting Screw on the other eylinder. It may be found that when both leads are connected to the Sparking Plugs, the Engine runs slightly quicker than desirable, in which case, a slight readjustment of the Throttle Stop Screws will put this right. It is essential that the speed of idling on both Cylinders is approximately n the initial opening of the Throttle.
It is essential with Twin Carburetters that the Throttle Slides are a good fit in the bodies, and aiso that there is no suspicion of air leaks at either Rer
Regarding the lower end of the Throttle range, which is always the more dificultito set, one can oniy take excessive pains to make quite sure that lash or difference in the amount of back lash between one Carburetter an and so resulting in lumpy running.
To check theyopening of the Throttle simultaneously, shut the Twist Grip back so that the Throttles are resting on the Throttle Stop Screws in their final position of adjustment ; then insert the fingers into the air intakes and press them on the Throtties and with the other hand, gently open by the Twist Grip and feel that the TFrottles lift off their stops at the same time.

## SERVICE ARRANGEMENTS

There are many AMAL Service Stockists in Great Britain and also in other countries where Motor-cycling is popular: They have information about advised to purchase GENUINE AMAL SPARES through them, at our ALL GENUINE JETS are stamped with the name AMAL and with the Calibration Number.

## GUARANTEE

The\% Company take all possible reasonable care in the manufacture and the quality of their products. Purchasers are informed that, any part proved to be defective in manufacture or quality, alad returned to
of its purchase new, will be replaced. of its purchase new, will be replaced. The Company must respectfully point out however, that its responsibility and
that of its agents, stockists and dealers, is limited to this Guarantee and that they cannot, under any circumstances, be held responsible for any loss or for any contingent or resulting liability arising through any defect. part of the ,original equipment of machines purchased new. Printed in England.
$50 \mathrm{~m} / 3 / 69$. W.

# AMAL 

## RE-ASSEMBLING

When replacing the valve assembly see that the jet needle goes into the holes in the choke tube, needle jet and main jet and that both the throttle and air valve spring locate correctly in the mixing chamber top.

When refitting the float, engage the float needle recess in the horseshoe section of the float and fit in float chamber. Check that the needle jet (24) jet holder (28) and main jet (29) are fully tightened together before screwing assembly into the body.

## HOW TO TRACE FAULTS

There are only two possible faults in carburation, either richness or weakness of mixture

INDICATIONS OF:-

## RICHNESS.

Black smoke in exhaust. Petrol spraying out of carburetter. Four strokes, eight-stroking. Two strokes, four-stroking. Heavy, lumpy running. Sparking plug sooty.

If richness or weakness is present,
(I) Petrol feed.
(2) Air leaks.
(3) Defective oviorn parts.

(4) Air cleaner being choked up.
(5) A/air cleaner having been removed.

Rerfing the silencer or running with a straight through pipe requires ler setting.

Having verified the correctness of fuel feed and that there are no air leaks, check over ignition, valve operation and timing. Now at throttle position shown on page 7, fig. 5 , test to see if mixtures are rich or weak. This is done by partially closing the air valve, and if engine runs better weakness is indicated, but if engine runs worse richness is indicated.

To remedy, proceed as follows :-

To cure richness,
Position 1. Fit smaller main jet.
Position 2. Screw out pilot air adjusting screw.

Position 3. Fit a throttle with larger cutaway (page 6).

Position 4. Lower needle one or two grooves (page 6).

To cure weakness. Fit larger main jet.

Screw pilot air adjusting screw in.

Fit a throttle with smaller cutaway (page 6).

Raise needle one or two greoves (page 6).

NOTE. It is not correct to cure a rich mixture at half throttle by fitting a smaller main jet because the main jet may be correct for power at full throttle: the proper thing to do is to lower the needle.
